

IN THE CLAIMS:

Please amend claims 1 and 14-27 as shown below. The following listing of claims will replace all prior versions, and listings, of claims in the application.

1. (Currently Amended) A method comprising:

generating a message from a source application on a first computer system, wherein the source application is configured to communicate using an application programming interface (API) to a distributed computing infrastructure, and wherein the source application is network-unaware;

sending the message from the source application to the distributed computing infrastructure using the API;

the distributed computing infrastructure translating the message from an original format to a portable format on the first computer system, thereby generating a portable message, wherein the portable message comprises metadata which comprise identifying characteristics of the source application; and

sending the portable message from the first computer system to a second computer system using peer-to-peer message passing between the first computer system, the second computer system, and optionally one or more intermediary computer systems;

receiving the portable message at the second computer system; and

the distributed computing infrastructure routing the portable message to a target application on the second computer system based on the metadata, wherein the target application is configured to communicate using the API to the distributed computing infrastructure [[API]], and wherein the target application is network-unaware.

2. (Original) The method of claim 1,

wherein the source application routes network activity through the API to the distributed computing infrastructure, and wherein the target application receives network activity through the API from the distributed computing infrastructure.

3. (Original) The method of claim 1,

wherein the source application and the target application comprise chat applications enabling a user of the first computer system and a user of the second computer system to communicate using text;

wherein the message from the source application comprises text to be displayed by the target application on the second computer system.

4. (Original) The method of claim 1,

wherein the source application and the target application comprise shared whiteboard applications enabling a user of the first computer system and a user of the second computer system to communicate using graphical data on a virtual shared whiteboard;

wherein the message from the source application comprises graphical data to be displayed by the target application on the second computer system.

5. (Original) The method of claim 1,

wherein the source application and the target application comprise collaborative applications enabling a user of the first computer system and a user of the second computer system to communicate using collaborative data;

wherein the message from the source application comprises collaborative data to be displayed by the target application on the second computer system.

6. (Original) The method of claim 1, further comprising:

determining an application type of the target application based on the metadata of the portable message;

determining whether an existing instance of the application type of the target application is running on the second computer system;

wherein the routing the portable message to the target application comprises routing the portable message to the existing instance if the existing instance of the application type of the target application is running on the second computer system; and

wherein the routing the portable message to the target application comprises routing the portable message to a new instance of the target application if the existing

instance of the application type of the target application is not running on the second computer system.

7. (Original) The method of claim 1, further comprising:

delivering a payload of the message to the target application.

8. (Original) The method of claim 1, further comprising:

the distributed computing infrastructure translating the portable message from the portable format to the original format on the second computer system.

9. (Original) The method of claim 1, further comprising:

invoking functionality of the second computer system in response to the message.

10. (Original) The method of claim 9,

wherein the invoking functionality on the second computer system comprises instructing the target application to take one or more actions.

11. (Original) The method of claim 1,

wherein the portable message is sent from the first computer system to the second computer system and one or more additional computer systems using multicast peer-to-peer messaging.

12. (Original) The method of claim 1,

wherein the portable message is sent from the first computer system to the second computer system and one or more additional computer systems using broadcast peer-to-peer messaging.

13. (Original) The method of claim 1,

wherein the portable format comprises XML, and wherein the portable messages comprise XML messages.

14. (Currently Amended) A ~~earlier~~ computer-readable storage medium comprising program instructions, wherein the program instructions are computer-executable to implement:

generating a message from a source application on a first computer system, wherein the source application is configured to communicate using an application programming interface (API) to a distributed computing infrastructure, and wherein the source application is network-unaware;

sending the message from the source application to the distributed computing infrastructure using the API;

the distributed computing infrastructure translating the message from an original format to a portable format on the first computer system, thereby generating a portable message, wherein the portable message comprises metadata which comprise identifying characteristics of the source application; and

sending the portable message from the first computer system to a second computer system using peer-to-peer message passing between the first computer system, the second computer system, and optionally one or more intermediary computer systems;

receiving the portable message at the second computer system; and

the distributed computing infrastructure routing the portable message to a target application on the second computer system based on the metadata, wherein the target application is configured to communicate using the API to the distributed computing infrastructure ~~[[API]]~~, and wherein the target application is network-unaware.

15. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 14,

wherein the source application routes network activity through the API to the distributed computing infrastructure, and wherein the target application receives network activity through the API from the distributed computing infrastructure.

16. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 14,

wherein the source application and the target application comprise chat applications enabling a user of the first computer system and a user of the second computer system to communicate using text;

wherein the message from the source application comprises text to be displayed by the target application on the second computer system.

17. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 14,

wherein the source application and the target application comprise shared whiteboard applications enabling a user of the first computer system and a user of the second computer system to communicate using graphical data on a virtual shared whiteboard;

wherein the message from the source application comprises graphical data to be displayed by the target application on the second computer system.

18. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 14,

wherein the source application and the target application comprise collaborative applications enabling a user of the first computer system and a user of the second computer system to communicate using collaborative data;

wherein the message from the source application comprises collaborative data to be displayed by the target application on the second computer system.

19. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 14, wherein the program instructions are further computer-executable to implement:

determining an application type of the target application based on the metadata of the portable message;

determining whether an existing instance of the application type of the target application is running on the second computer system;

wherein the routing the portable message to the target application comprises routing the portable message to the existing instance if the existing instance of the application type of the target application is running on the second computer system; and

wherein the routing the portable message to the target application comprises routing the portable message to a new instance of the target application if the existing instance of the application type of the target application is not running on the second computer system.

20. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 14, wherein the program instructions are further computer-executable to implement:

delivering a payload of the message to the target application.

21. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 14, wherein the program instructions are further computer-executable to implement:

the distributed computing infrastructure translating the portable message from the portable format to the original format on the second computer system.

22. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 14, wherein the program instructions are further computer-executable to implement:

invoking functionality of the second computer system in response to the message.

23. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 22,

wherein the invoking functionality on the second computer system comprises instructing the target application to take one or more actions.

24. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 14,

wherein the portable message is sent from the first computer system to the second computer system and one or more additional computer systems using multicast peer-to-peer messaging.

25. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 14,

wherein the portable message is sent from the first computer system to the second computer system and one or more additional computer systems using broadcast peer-to-peer messaging.

26. (Currently Amended) The ~~earlier~~ computer-readable storage medium of claim 14,

wherein the portable format comprises XML, and wherein the portable messages comprise XML messages.

27. (Currently Amended) A system comprising:

a first computer system comprising a first CPU and a first memory; and

a second computer system comprising a second CPU and a second memory;

wherein the first computer system and the second computer system are communicatively coupled via a network;

wherein the first memory stores program instructions which are executable by the first CPU to:

generate a message from a source application on the first computer system, wherein the source application is configured to communicate using an application programming interface (API) to a distributed computing infrastructure, and wherein the source application is network-unaware;

send the message from the source application to the distributed computing infrastructure using the API;

using the distributed computing infrastructure, translate the message from an original format to a portable format on the first computer system, thereby generating a portable message, wherein the portable message comprises metadata which comprise identifying characteristics of the source application; and

send the portable message from the first computer system to the second computer system using peer-to-peer message passing between the first computer system, the second computer system, and optionally one or more intermediary computer systems; and

wherein the second memory stores program instructions which are executable by the second CPU to:

receive the portable message at the second computer system; and

using the distributed computing infrastructure, route the portable message to a target application on the second computer system based on the metadata, wherein the target application is configured to communicate using the API to the distributed computing infrastructure [[API]], and wherein the target application is network-unaware.

28. (Original) The system of claim 27,

wherein the source application routes network activity through the API to the distributed computing infrastructure, and wherein the target application receives network activity through the API from the distributed computing infrastructure.

29. (Original) The system of claim 27,

wherein the source application and the target application comprise chat applications enabling a user of the first computer system and a user of the second computer system to communicate using text;

wherein the message from the source application comprises text to be displayed by the target application on the second computer system.

30. (Original) The system of claim 27,

wherein the source application and the target application comprise shared whiteboard applications enabling a user of the first computer system and a user of the second computer system to communicate using graphical data on a virtual shared whiteboard;

wherein the message from the source application comprises graphical data to be displayed by the target application on the second computer system.

31. (Original) The system of claim 27,

wherein the source application and the target application comprise collaborative applications enabling a user of the first computer system and a user of the second computer system to communicate using collaborative data;

wherein the message from the source application comprises collaborative data to be displayed by the target application on the second computer system.

32. (Original) The system of claim 27,

wherein the program instructions are executable by the second CPU to:
determine an application type of the target application based on the metadata of the portable message;

determine whether an existing instance of the application type of the target application is running on the second computer system;

wherein the routing the portable message to the target application comprises routing the portable message to the existing instance if the existing instance of the application type of the target application is running on the second computer system; and

wherein the routing the portable message to the target application comprises routing the portable message to a new instance of the target application if the existing instance of the application type of the target application is not running on the second computer system.

33. (Original) The system of claim 27,

wherein the program instructions are executable by the second CPU to:
deliver a payload of the message to the target application.

34. (Original) The system of claim 27,

wherein the program instructions are executable by the second CPU to:
using the distributed computing infrastructure, translate the portable message from the portable format to the original format on the second computer system.

35. (Original) The system of claim 27,

wherein the program instructions are executable by the second CPU to:
invoke functionality of the second computer system in response to the message.

36. (Original) The system of claim 35,

wherein the invoking functionality on the second computer system comprises instructing the target application to take one or more actions.

37. (Original) The system of claim 27,

wherein the portable message is sent from the first computer system to the second computer system and one or more additional computer systems using multicast peer-to-peer messaging.

38. (Original) The system of claim 27,

wherein the portable message is sent from the first computer system to the second computer system and one or more additional computer systems using broadcast peer-to-peer messaging.

39. (Original) The system of claim 27,

wherein the portable format comprises XML, and wherein the portable messages comprise XML messages.
